Author Positionality

The first author has industry experience as a software engineer in a large company which provided them familiarity with documentation workflows and collaborating with technical writers, followed by experience with qualitative research methods in a software engineering lab at a university. The remaining authors are researchers in software engineering, machine learning, human-computer interaction (HCI), and computer supported cooperative work (CSCW). This background enables us to approach documentation review from both technical and sociotechnical perspectives. From a methods perspective, our team has experience with qualitative research approaches, specifically interview studies and ethnographic studies in software engineering and HCI. Our background positions us to approach the documentation quality process through the angle of experience of practitioners, affected by their social environment, and mediated with the tools used in this process.
